

CSC/CPE 138 - Computer Network Fundamentals

Transport Layer

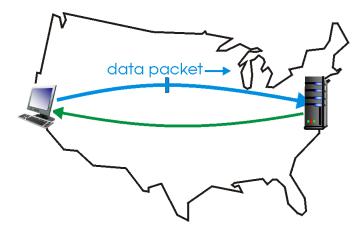

The presentation was adapted from the textbook: *Computer Networking: A Top-Down Approach* 8th edition Jim Kurose, Keith Ross, Pearson, 2020

rdt3.0: pipelined protocols operation

pipelining: sender allows multiple, "in-flight", yet-to-be-acknowledged packets

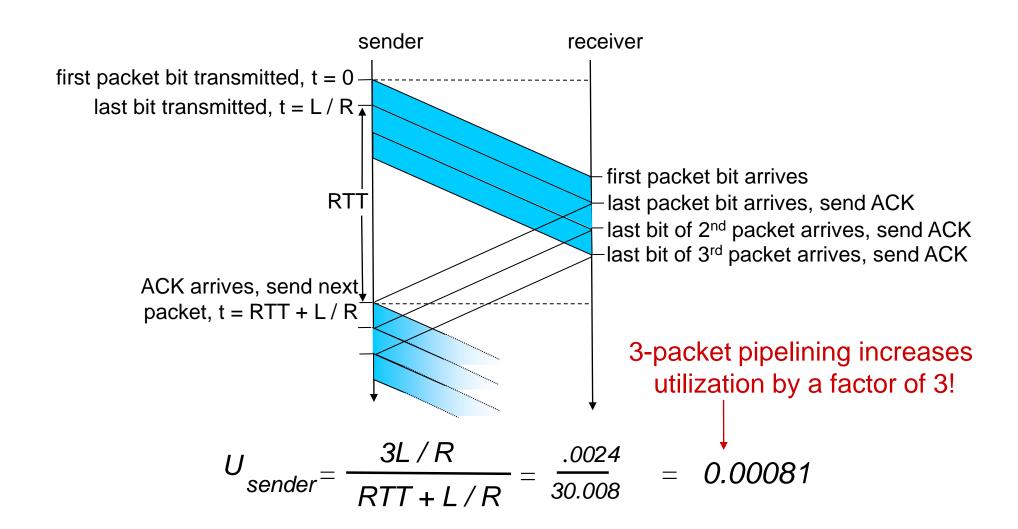

- range of sequence numbers must be increased
- buffering at sender and/or receiver

(a) a stop-and-wait protocol in operation

Pipelining: increased utilization

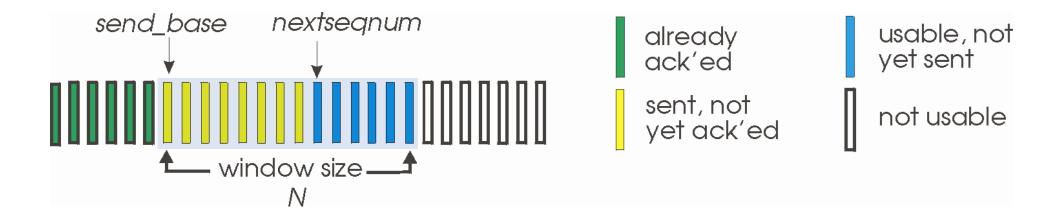

Go-Back-N: sender

- sender: "window" of up to N, consecutive transmitted but unACKed pkts
 - k-bit seq # in pkt header

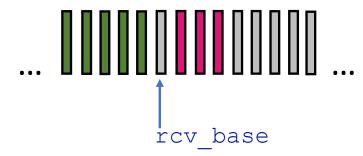

- cumulative ACK: ACK(n): ACKs all packets up to, including seq # n
 - on receiving ACK(n): move window forward to begin at n+1
- timer for oldest in-flight packet
- timeout(n): retransmit packet n and all higher seq # packets in window

Go-Back-N: receiver

- ACK-only: always send ACK for correctly-received packet so far, with highest in-order seq #
 - may generate duplicate ACKs
 - need only remember rcv base
 - on receipt of out-of-order packet:
 - can discard (don't buffer) or buffer: an implementation decision
 - re-ACK pkt with highest in-order seq #

Receiver view of sequence number space:

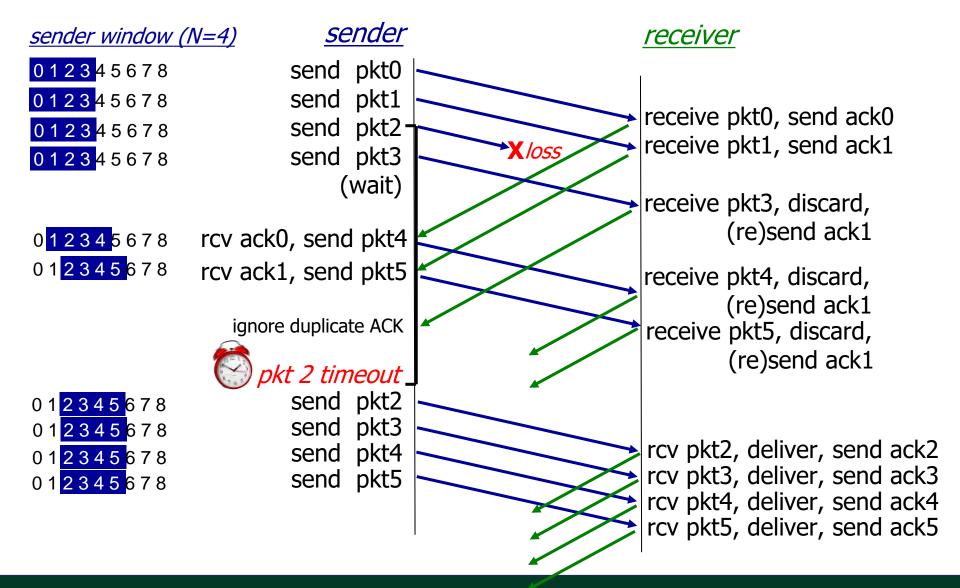

received and ACKed

Out-of-order: received but not ACKed

Not received

Go-Back-N in action

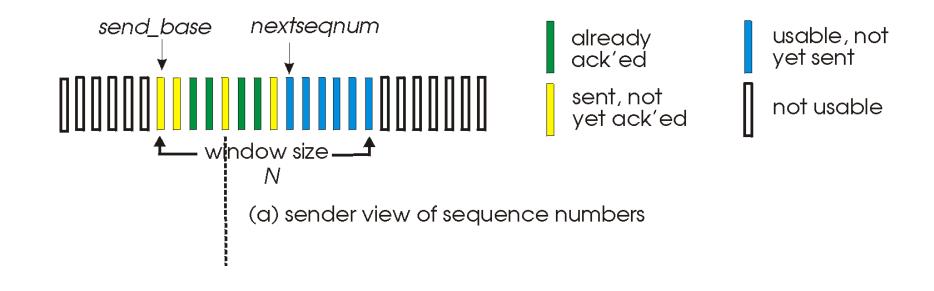

Selective repeat

- receiver individually acknowledges all correctly received packets
 - buffers packets, as needed, for eventual in-order delivery to upper layer
- sender times-out/retransmits individually for unACKed packets
 - sender maintains timer for each unACKed pkt
- sender window
 - N consecutive seq #s
 - limits seq #s of sent, unACKed packets

Selective repeat: sender, receiver windows

Selective repeat: sender and receiver

sender

data from above:

if next available seq # in window, send packet

timeout(*n*):

resend packet n, restart timer

ACK(n) in [sendbase,sendbase+N-1]:

- mark packet n as received
- if n smallest unACKed packet, advance window base to next unACKed seq #

receiver

packet n in [rcvbase, rcvbase+N-1]

- send ACK(n)
- out-of-order: buffer
- in-order: deliver (also deliver buffered, in-order packets), advance window to next not-yetreceived packet

packet n in [rcvbase-N,rcvbase-1]

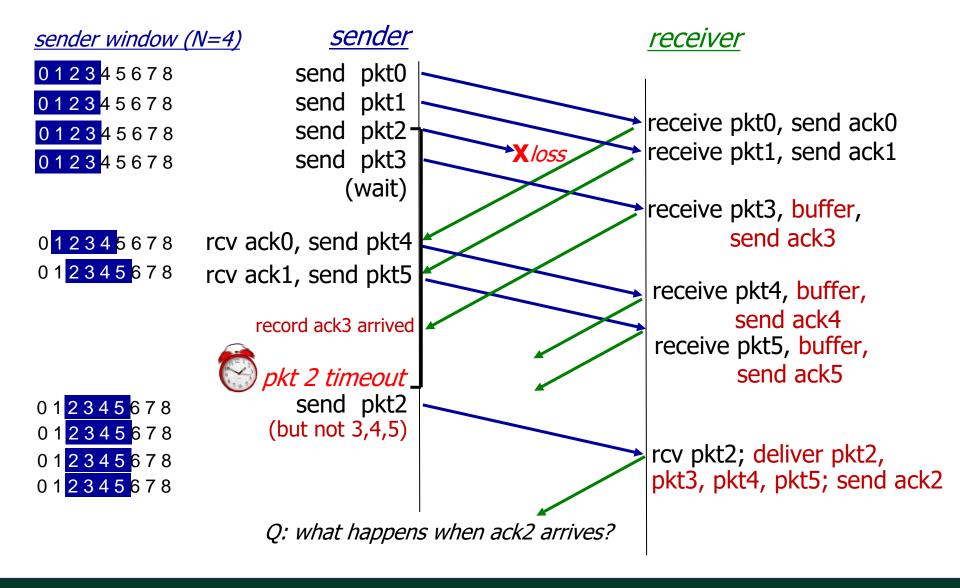

ACK(n)

otherwise:

ignore

Selective Repeat in action

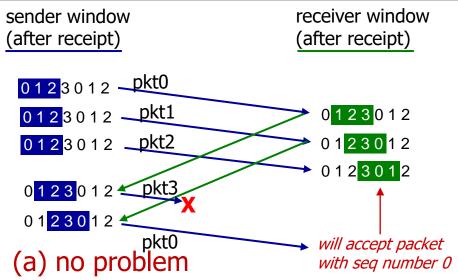

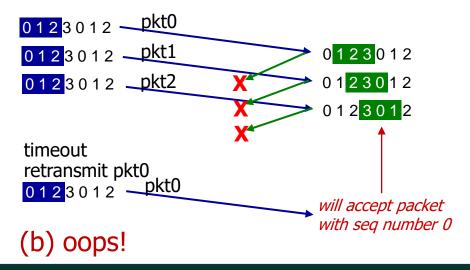

Selective repeat: a dilemma!

example:

- seq #s: 0, 1, 2, 3 (base 4 counting)
- window size=3

Selective repeat: a dilemma!

example:

- seq #s: 0, 1, 2, 3 (base 4 counting)
- window size=3

Q: what relationship is needed between sequence # size and window size to avoid problem in scenario (b)?
